

Amendments to the Specification:

Please replace the paragraph beginning at page 7, line 4 as with the following amended paragraph:

-- In use, the fabricator manipulates the adjustable rails 30 to the desired dimensions on the first mold ~~38~~28 and a second, complementary mold 36 shown in FIG. 3. The molds are then closed together as shown in the cross section views of FIG.4. The foregoing operations can occur either before or after the mold is placed into a conventional thermoforming apparatus such as a vacuum forming device or a rotomolder. When rotational molding is employed, it may be advantageous to counterweight the molds 28, 36 so that the center of gravity of the closed mold assembly is disposed along the axis about which the mold is spun. --
